

This well was drilled to a bright spot on a 3-D seismic interpretation. The well was offset on the surface location due to an extensive bog / swamp and drilled directionally into the zone from a dry surface location.

The well encountered some sloughing shale problems in the Blackstone formation which caused us several down days due to reaming and backreaming on bit trips. Otherwise the well was drilled to a successful conclusion with little to no grief.

The well was cased 20 meters below the Laternal Sandstone. This well has good potential as a Laternal Sandstone Oil Well.
